General information

Self-heating correlated to installation and ambient conditions as well as to electronics and supply voltage must be considered for precise thermal dimensioning. Operating the encoder close to the maximum limits requires measuring the real prevailing temperature at the encoder flange.

Terminal assignment

Flylead connector M12, 8-pin, male, A-encoding

Terminal significance

SET	Zero setting. Input for zero setting at any position. The zero setting operation is triggered by a high pulse and has to be in line with the selected direction of rotation (DIR). Impulse duration >100 ms. Connect to 0 V after zero setting for maximum interference immunity.
DIR	Counting direction input. The input is standard on high. For maximum interference immunity connect to +Vs respectively 0 V depending on counting direction. CW HIGH - CCW LOW

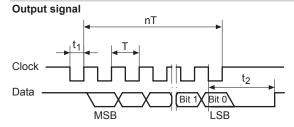

(Version with DATAVALID does not include the

Trigger level		
Control inputs	Input circuit	
Maximal	0+Vs	
Input level Low	<1 V	
Input level High	>2.1 V	

Applies to standard cable lengths up to 2 m, for longer cables the voltage drop must be taken into account.

counting directon input).

Data transfer

T = 0.510 µs	t ₁ = 0.255 μs
t ₂ = 20 ±2 μs	f max. = 2 MHz

Data acquisition time ta

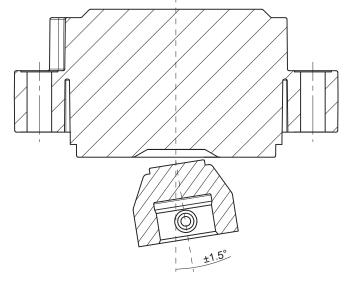

Following timing of the SSI Masters is the requirement for a data refresh rate of typ. 2 μ s. If this is not fulfilled the data refresh rate is <50 μ s. ta <5000 μ s

ta jitter <±2 µs
